I need your help. Making a memory for Claude that lives in the cloud or on my home lab or somewhere otherwise accessible to clod wherever I install it. Same with the, claudmd files as well. And anything else for setting skills, I wanna trans personality that basically turns you into what I need right when I log in. And I want you to remember history of everything I've worked on within Claude and Claude Code.

Great vision — this is totally buildable, especially with your home lab setup. Before I design the architecture, I need to fill some gaps:
While you answer those, one more critical one:
Once I have your answers I'll design the full architecture — MCP memory server, CLAUDE.md strategy, personality injection system, and history capture pipeline — tuned to exactly how you work.

Q: How should Claude *receive* the memory/context — how should it get injected?
A: MCP server (Claude Code can connect natively)

Q: What counts as 'history' to track?
A: Every project I touch (code, conversations, decisions)

Got it. Still missing a few from the first set — quick fills:

Q: Where does the MCP memory server live?
A: Both — local + GitHub mirror

Q: Personality — what role does Claude snap into on load?
