We are going to make a personal assistant. This will be an LLM and I want to create openclaw-like functionality on my local machine using ollama and gemma4. I want to orchestrate subprograms from the main LLM. Whatever I would like to control under this roof. I want to include our budgeting program, grocery program, an application development team, etc. I want it to act like "Jarvis" its a central hub for me and everything going on house repairs, kids schedules, track stuff, budgets, food, schedules, etc. I also want this structured to teach me how to do it. We should be able to build this with unicorn-team and claude code. I would like you to prompt me for any questions or gaps you see in my statement, and I would like you to utilize tools in your MCP to design what I would need in claude code.

Apr 10

This is a great project — a local, self-hosted orchestrator LLM that routes to specialized sub-agents and tools. Before I design the architecture, I need to fill some gaps:
While you answer those, here are some additional questions I'd love your input on as text:

1. **"Unicorn-team"** — is this a Claude Code workflow/project you already have, or a concept you want to build? Tell me what it looks like today.
2. **Existing data** — where do you currently track kids' schedules, house repairs, budgets? Google Calendar, spreadsheets, Notion, paper, a mix?
3. **Hardware** — how much RAM/VRAM does your machine have? Gemma 4 model size selection depends on this (e.g., Gemma 4 12B vs 27B).
4. **Privacy scope** — should Jarvis stay 100% local (no cloud calls), or is it okay to call Claude API / external APIs for some things (weather, calendar sync, etc.)?
5. **"Teach me" depth** — do you want the codebase heavily commented with learning explanations, or more like a guided tutorial where we build it step-by-step together?

Once I have your answers, I'll design the full system architecture — the orchestrator pattern, sub-agent routing, data [illegible] n you can execute in Claude Code.
